

# AS5172A / AS5172B

## High-Resolution On-Axis Magnetic Angular Position Sensor with PSI5 Output

### General Description

The AS5172 is a magnetic position sensor with a high resolution 12-bit PSI5 output according to PSI5 specification Version 1.3 and 2.1.

Based on a Hall sensor technology, this device measures the orthogonal component of the flux density ( $B_z$ ) over a full-turn rotation and compensates for external stray magnetic fields with a robust architecture based on a 14-bit sensor array and analog front-end (AFE). A sub-range can be programmed to achieve the best resolution for the application. To measure the angle, only a simple two-pole magnet rotating over the center of the package is required. The magnet may be placed above or below the device. The absolute angle measurement provides an instant indication of the magnet's angular position. The AS5172 operates up to a voltage of 16.5V and is protected against overvoltage up to +20V. In addition, the supply pins are protected against reverse polarity up to -18V.

Programmability over the VDD pin reduces the number of pins on the application connector.

The AS5172 is available in a TSSOP14 package and in a SIP package.

The SIP package (System in Package) has integrated the AS5172 sensor die together with the decoupling capacitors necessary to pass system level ESD and EMC requirements. No additional components and PCB on the sensor side are needed.

The product is defined as SEooC (Safety Element out of Context) according to ISO26262.

The product is fully system level EMC and ESD tested according to OEM standards.

*Ordering Information and Content Guide appear at end of datasheet.*

## Key Benefits and Features

The benefits and features of this device are listed below:

**Figure 1:**  
Added Value of Using AS5172

Benefits	Features
<ul style="list-style-type: none"> <li>Resolve small angular excursion with high accuracy</li> </ul>	<ul style="list-style-type: none"> <li>12-bit resolution @90° minimum arc</li> </ul>
<ul style="list-style-type: none"> <li>Accurate angle measurement</li> </ul>	<ul style="list-style-type: none"> <li>Low output noise, low inherent INL</li> </ul>
<ul style="list-style-type: none"> <li>Higher durability and lower system costs (no shield needed)</li> </ul>	<ul style="list-style-type: none"> <li>Magnetic stray field immunity</li> </ul>
<ul style="list-style-type: none"> <li>Enabler for safety critical applications</li> </ul>	<ul style="list-style-type: none"> <li>Functional safety, diagnostics</li> </ul>
<ul style="list-style-type: none"> <li>Suitable for automotive applications</li> </ul>	<ul style="list-style-type: none"> <li>AEC-Q100 Grade 0 qualified (AS5172B)</li> <li>AEC-Q100 Grade 1 qualified (AS5172A)</li> </ul>
<ul style="list-style-type: none"> <li>SIP Package</li> </ul>	<ul style="list-style-type: none"> <li>System cost reduction – no PCB and additional components are needed</li> </ul>

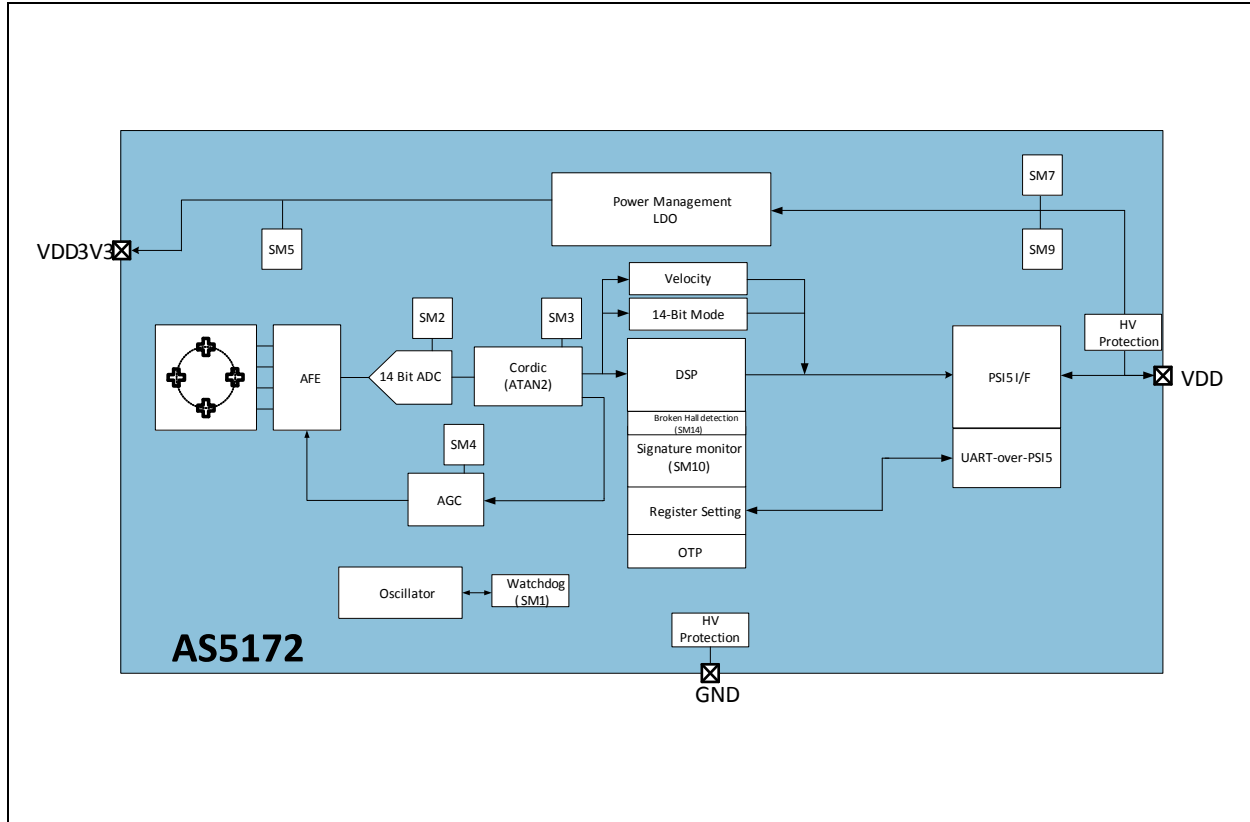

## Applications

The AS5172 is ideal for automotive applications like brake and gas pedals, throttle valve and tumble flaps, steering angle sensors, chassis ride, EGR, fuel-level measurement systems, 2/4WD switch, and contactless potentiometers.

### Block Diagram

The functional blocks of this device are shown below:

**Figure 2:**  
Functional Blocks of the AS5172

**Note(s):**

## Absolute Maximum Ratings

Stresses beyond those listed under [Absolute Maximum Ratings](#) may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated under [Operating Conditions](#) is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Figure 7:**  
Absolute Maximum Ratings

Symbol	Parameter	Min	Max	Units	Comments
<b>Electrical Parameters</b>					
VDD	DC Supply Voltage at VDD pin	-18	20	V	Not operational
VREGOUT	DC Voltage at the VDD3V3 pin	-0.3	5	V	
ISCR	Input Current (latch-up immunity)	±100		mA	AEC-Q100-004
<b>Continuous Power Dissipation (T<sub>AMB</sub> = 70°C)</b>					
P <sub>T_Tssop</sub>	Continuous Power Dissipation		377	mW	
P <sub>T_SIP</sub>	Continuous Power Dissipation		377	mW	
<b>Electrostatic Discharge</b>

Symbol	Parameter	Min	Max	Units	Comments
<b>Temperature Ranges and Storage Conditions</b>					
$T_{AMB}$	Operating Temperature Range	-40	125	°C	AS5172A ambient temperature
$T_{AMB\_LM}$	Operating Temperature Range	-40	150	°C	AS5172B ambient temperature
$T_{aProg}$	Programming Temperature	5	45	°C	Programming@ room temperature (25°C ± 20°C)
$T_{STRG}$	Storage Temperature Range	-55	125	°C	
$T_{BODY}$	Package Body Temperature		260	°C	The reflow peak soldering temperature (body temperature) is specified according to IPC/JEDEC J-STD-020 "Moisture/Reflow Sensitivity Classification for Non-hermetic Solid State Surface Mount Devices." The lead finish for Pb-free leaded packages is "Matte Tin" (100% Sn)
$RH_{NC}$	Relative Humidity (non-condensing)	5	85	%	
MSL	Moisture Sensitivity Level	3			Represents a maximum floor life time of 168 hours

### System Electrical and Timing Characteristics

All limits are guaranteed. The parameters with min and max values are guaranteed with production tests or SQC (Statistical Quality Control) methods.

All in this datasheet defined tolerances for external components need to be assured over the whole operation conditions range and also over lifetime.

#### Overall Condition:

$T_{AMB}$  = -40°C to 125°C for AS5172A;

$T_{AMB}$  = -40°C to 150°C for AS5172B;

VDD = 4V – 12V (sync pulse voltage not included);

Components spec; unless otherwise noted

**Figure 8:**  
**Operating Conditions**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
VDD	Positive Supply Voltage	Static condition	4		12	V
VDD_Rx	Positive Supply Voltage	Dynamic condition	4		16.5	V
VDD3	Regulator Voltage		3.3	3.45	3.6	V
IDD	Current Consumption	No programming and no PSI5 communication	11	15	19	mA
IDDProg	Current Consumption	During programming		80		mA
IDDProgUN	Current Consumption of Unprogrammed Device	Unprogrammed device @ $T_{AMB} = 25^{\circ}\text{C} \pm 10^{\circ}\text{C}$			49	mA
IDD max	Current Consumption	IDD + IS_Common			49	mA
IS_Common	Sink Current (common mode)		22	26	30	mA
IS_low power mode		Sink current (low power mode)	11	13	15	mA

## Electrical and Timing Characterization of the PS15 Interface

This chapter describes the synchronization signal from the ECU according to the PS15 specification V1.3 and V2.1. The parameters in this chapter are not reflecting the full specification range of the detection circuit for the synchronization signal.

### Synchronization Signal PS15 V1.3

**Figure 12:**  
Synchronization Signal

The synchronization signal start time  $t_0$  is defined as a crossing of the  $V_{t0}$  value. In the “Sync Start” phase before this point, a “rounding in” of the voltage starting from  $V_{CE, Base}$  to  $V_{t0}$  is allowed for a maximum of  $t_1$ . During the “Sync Slope” phase, the voltage rises within given slew rates to a value between the minimum sync signal voltage  $V_{t2}$  and the maximum interface voltage  $V_{CE, max}$ . After maintaining the voltage between this limits until a minimum of  $t_3$ , the voltage decreases in the “Sync Discharge” phase until having reached the initial  $V_{CE, base}$  value until latest  $t_4$ .

**Figure 13:**  
Synchronization Signal PS15 V1.3 <sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
VBase	Base Supply Voltage	Voltage value at ECU	5.7		11	V
Vto	Sync Slope Reference Voltage	Reference to VBase		0.5		V
Vt2	Sync Signal Sustain Voltage	Reference to VBase	3.5			V
Vce,max	Maximum Interface Voltage				16.5	V
t0	Reference Time	Reference time base; time when the sync signal crosses Vt0		0		μs
t1	Sync Signal Earliest Start	V=VCE Delta current less than 2mA	-3		0	μs
t2	Sync Signal Sustain Start	@ Vt2		7		μs
	Sync Slope Rising Slew Rate	Lower limit is valid for Vt0 to Vt2	0.43	1.0	1.5	V/μs
	Sync Slope Falling Slew Rate		-1.5			V/μs

Tslot1	Start of Time Slot 1		44			μs

**Note(s):**

1. The parameters in this table are just info parameters and therefore not production tested. The production related parameters are in the [PSIS Block Parameters](#) table.

### Synchronization Signal Detection

The AS5172 has to detect the trigger within the “trigger window” during the rising slope of the synchronization signal at the trigger point with the trigger voltage  $V_{TRIG}$  and the trigger time  $t_{TRIG}$

Figure 15:  
Trigger Window

In order to take into account voltage differences at different points of the interface lines, an additional safety margin for the trigger detection is defined by  $V_{EMC}$  and  $t_{EMC}$ .

The values are based on the PS15 specification and shows the detection of the synchronization signal from the ECU according the PS15 specification.

**Figure 16:**  
**Synchronization Detection <sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
VEMC_C	Margin for Voltage Variations	Common power mode	-0.9		0.9	V
VEMC_LP	Margin for Voltage Variations	Low power mode	-0.7		0.7	V
VTrig_C	Trigger Voltage Threshold	Common power mode	1.4	2.0	2.6	V
VTrig_LP	Trigger Voltage Threshold	Low power mode	1.2	1.5	1.8	V
tTRIG	Nominal Trigger Detection Time	@ V <sub>TRIG</sub> , @ AS5172 Pins; Referenced to a straight sync signal slope with nominal slew rate of 0.43 V/ $\mu$ s	2.1	3.5	4.9	$\mu$ s
VCE,max	Maximum Interface Voltage				16.5	V
tEMC	Margin for Timing Variations of the Signal on the Interface Line	Relative to nominal trigger window time	-2.1		2.1	$\mu$ s
ttol detect	Tolerance of Internal Trigger Detection Delay				3	$\mu$ s
TTRIG	Trigger Detection Time	$T_{TRIG} = t_{TRIG} + t_{tol\ detect} + t_{EMC}$ ; Reference for AS5172 time base	0		10	$\mu$ s

**Note(s):**

1. The parameters in this table are just info parameters and therefore not production tested. The production related parameters are in the [PSI5 Block Parameters](#) table.

### Synchronization Signal with Discharge by AS5172

This chapter describes the modifications required if the ECU uses a special transceiver.

The parameters in this chapter are not reflecting the full specification range of the detection circuit for the synchronization signal

**Figure 17:**  
Synchronization Signal from ECU with Discharge by the AS5172

$V_{\text{TRIG EMC}}$	Trigger Voltage Threshold Under EMC (low power mode)	At $SL_{\text{RISE}} = 0.43 \text{ V}/\mu\text{s}$ ; For EMC $\leq 1V_{\text{PEAK}}$ $\geq 100\text{kHz}$ Not tested - Guaranteed by Design	0.5	1.5	2.5	V
$t_{\text{tol detect}}$	Tolerance of Internal Trigger Detection Delay				3	$\mu\text{s}$
$t_{\text{BLANK}}$	Output Signal Blanking Time	Blanking of trigger signal in digital part after first rising edge to avoid multiple trigger signals during EMC events. Not tested - Guaranteed by Design	121		135	$\mu\text{s}$
$V_{\text{COM}}$	Comparator Input Common Mode Voltage			1.5		V
$RES_{\text{div}}$	Resistor Divider Division Factor	Not tested - Guaranteed by Design 2% mismatch	7.84	8	8.16	V/V
$f_{\text{C\_LP}}$	Low Pass Filter Cut-Off Frequency	Not tested - Guaranteed by Design	2.5	5	7.5	kHz

## Detailed Description

The AS5172 is a Hall-based rotary magnetic position sensor using a CMOS technology. The lateral Hall sensor array converts the magnetic field component perpendicular to the surface of the chip into a voltage.

The signals coming from the Hall sensors are first amplified and filtered before being converted by the analog-to-digital converter (ADC). The output of the ADC is processed by the CORDIC block (Coordinate-Rotation Digital Computer) to compute the angle and magnitude of the magnetic field vector. The sensor and analog front-end (AFE) section works in a closed loop alongside an AGC to compensate for temperature and magnetic field variations. The calculated magnetic field strength (MAG), the automatic gain control (AGC) and the angle can be read through the UART-over-PSI5 protocol during programming.

The magnetic field coordinates provided by the CORDIC block are fed into a linearization block (DSP) which generates the transfer function.

The output of the AS5172 can be programmed to define a starting position (zero angle) and a stop position (maximum angle).

The AS5172 can be programmed through the VDD Pin with a special UART-over-PSI5 protocol which allows writing an on-chip non-volatile memory (One Time Programmable memory) where the specific settings are stored.

The AS5172 is equipped with a PSI5 Interface current driver and a PSI5 Interface receiver. The current driver drives the additional sink current to reach the I<sub>high</sub> level on the VDD. The receiver is comparing the voltage level at the VDD Pin with the internal voltage thresholds.

The Sensor to ECU communication is described in the chapters below and is based upon the PSI5 standard.

The AS5172 supports, according the PSI5 standard, the synchronous mode or in asynchronous mode.

In PSI5 V1.3 (10-bit mode), the asynchronous modes can only use one time slot per period. For a transmission of one 12/16 bit data word, two periods are necessary

AS5172 supports the bus modes PSI5-U and PSI5-P. The daisy chain mode is not supported.

## Register Description

### OTP (non-volatile memory) Register Description

Figure 20:  
OTP (non-volatile memory) Register Description

Address	Bit Nr.	Symbol	Description
0x01	0	Factory settings	<b>ams</b> factory settings
	1		
	2	Direction	Changes direction in 14-bit mode
	3	PSI5_14bit_angle	Enables 14-bit angle output
	4	PSI5_quad_info	Enables quadrant information
	5	PSI5_16bit_frame	Enables the PSI5 16-bit frame

## Programming

### UART-Over-PSI5

The AS5172 is equipped with a one wire UART-over-PSI5 interface based on a “Tooth Gap” similar method according to PSI5 specification, which allows reading and writing the registers as well as permanent programming of the non-volatile OTP memory (One Time Programmable).

By default the AS5172 is in the so-called *Communication Mode*. In this mode, it is possible to configure the register settings.

A voltage modulation on the supply lines (VDD and GND) is used to realize a Programmer-to-Sensor communication. The Sensor-to-Programmer communication is done with current modulation.

The physical layer of the two communication modes is shown in [Figure 23](#) and [Figure 24](#) below.

**Figure 23:**  
Bit Encoding of Programmer-to-Sensor Communication

A logical “0” is represented by a sync pulse ( $V_H$ ) on the VDD line for a duration of  $t_{BIT}$ . A logical “1” by the absence of the sync pulse ( $V_L$ ) for a duration of  $t_{BIT}$ .

**Figure 24:**  
Bit Encoding of Sensor-to-Programmer Communication

A logical "0" is represented by an increased sink current ( $I_H$ ) on the VDD line for a duration of  $t_{BIT}$ . A logical "1" by normal sink current ( $I_L$ ) for a duration of  $t_{BIT}$ .

**Figure 25:**  
UART-Over-PSIS Protocol

Symbol	Parameter	Conditions	Value	Unit
$V_H$	High Level Voltage		10	V
$V_L$	Low Level Voltage		7	V
$I_H$	High Level Sink Current	Typical value	49	mA
$I_L$	Low Level Sink Current	Typical value	19	mA
$t_{BIT}$		$\pm 5\%$	26	$\mu s$
Baudrate		$\pm 5\%$	38400	Baud

For further information please refer to application note *AN\_AS5172\_Programming\_Procedure\_V1-00*

**ams** also provides a programmer which supports the above-mentioned protocol. Please get in contact with the application engineering team.

### UART Protocol

The UART interface allows reading and writing two consecutive addresses. The standard UART sequence consists of four frames. Each frame begins with a start bit (START), which is followed by 8 data bits (D[0:7]), one parity bit (PAR), and a stop bit (STOP), as shown in Figure 26.

**Figure 26:**  
UART Protocol Frame

The PAR bit is even parity calculated over the data bits (D[7:0]). Each frame is transferred from LSB to MSB.

The first frame is the synchronization frame and consists D[7:0] = 0x55. This frame synchronizes the baud rate between the AS5172 and the programmer.

The second frame contains the register address (D[6:0] = ADDRESS) and the write/read command (WRITE: D[7]=0; READ: D[7]=1).

The third and fourth frame will be written/read to/from the location specified by ADDRESS and ADDRESS+1, respectively. Figure 27 and Figure 28 show examples of a WRITE and READ sequence.

**Figure 27:**  
Example of WRITE (Reg[0x23] = 0x20 and Reg [0x24] = 0x00)

**Figure 28:**  
**Example of READ (Reg[0x32] = 0xB6 and Reg [0x24] = 0x2C)**

### Reading of the 14-Bit Angle Information

To read the current position of the magnet (Angle) the following procedure is necessary:

1. Set the DSP\_reset bit in Reg(0x23) to 1. (WRITE Reg(0x23) = 0x20)
2. Read Angle\_CORDIC register (READ Reg(0x32) and Reg(0x33))
3. Set the DSP\_reset bit in Reg(0x23) to 0. (WRITE Reg(0x23) = 0x00)

The DSP\_reset bit resets the internal DSP. After a reset, the Angle\_CORDIC register is updated.

### Reading the Magnitude and AGC

To read the current Magnitude and AGC value following procedure is necessary:

1. Set the DSP\_reset bit in Reg(0x23) to 1. (WRITE Reg(0x23) = 0x20)
2. Read Magnitude and AGC register (READ Reg(0x34) and Reg(0x35))
3. Set the DSP\_reset bit in Reg(0x23) to 0. (WRITE Reg(0x23) = 0x00)

The DSP\_reset bit resets the internal DSP. After a reset, the Magnitude and AGC registers are updated.

### Exiting the Communication Mode

To exit the *Communication Mode* and enter *Functional Mode* a special Pass-to-function command is necessary. Therefore a specific value has to be written into registers 0x60 and 0x61.

Pass2Function: WRITE Reg(0x60) = 0x70 and Reg(0x61) = 0x51

The device is temporarily set to operational mode until a sensor reset happens.

### Burn the OTP Registers

To permanently program the device a special BurnOTP command is necessary. Therefore a specific value has to be written into registers 0x62 and 0x63.

BurnOTP: WRITE Reg(0x62) = 0x70 and Reg(0x63) = 0x51

This commands permanently burns the OTP memory based on poly silicon fuses. After fusing a verification of the burn quality is mandatory to avoid bit-flips over temperature and lifetime. This can be done with the GLoad operation. For further information please refer to application note [AN\\_AS5172\\_Programming\\_Procedure\\_V1-00](#).

### AS5172 Transfer Function

After programming the Customer\_lock in the OTP or by using the Pass-to-function command the AS5172 is working in the selected PS15 mode over the VDD pin.

The DSP block generates a linear transfer function proportional to the angle of the rotating magnet which is fed into the PS15 interface. The PS15 interface works with 10-bit resolution in PS15 V1.3 and 12-bit resolution in PS15 V2.1. [Figure 29](#) shows the transfer function in detail.

**Figure 29:**  
Transfer Function

**Figure 30:**  
**PSI5 Protocol Output Resolution**

Symbol	Parameter	Conditions	Value	Unit
OTR_V1.3	Output Resolution PSI5 V1.3	PSI5 V1.3	10	Bit
OT1			-480	LSB
OT2			+480	LSB
OTR_V2.1	Output Resolution PSI5 V2.1	PSI5 V2.1	12	Bit
OT1			-2048	LSB
OT2			+2048	LSB

The PSI5 output characteristic is programmable in the OTP memory. The parameters T1, T2 and BP define the linear transfer function. [Figure 29](#) shows a simple example of a typical output function.

The mechanical starting point T1 and the mechanical end point T2 define the mechanical range. The BP (Breakpoint) defines the transition point between OT1 and OT2.

These parameters are input parameters. Using a DLL provided by **ams**, these parameters are converted into the final OTP parameters: CLH, CLL, Offset, Gain and BP.

For detailed information regarding the calculation DLL please get in contact with the application engineering team at **ams**.

### Multiple Quadrants

The multiple quadrant option allows repeating the same output slope up to four times over a full 360° rotation as shown in [Figure 32](#), [Figure 33](#), [Figure 34](#) and [Figure 35](#). The Quadrant bits in register (0x13) set the number of quadrant as shown in [Figure 31](#). Additionally a built-in quadrant detection can indicate the currently active quadrant in a special PSI5 data frame. For more information please refer to chapter [PSI5 Modes](#).

**Figure 31:**  
Quadrant Selection

Quadrant	Number of Quadrants	Max. Mechanical Range
00	Single	360°
01	Dual	180°
10	Triple	120°
11	Quadruple	90°

**Figure 32:**  
Single Quadrant

**Figure 33:**  
Dual Quadrant

**Figure 34:**  
**Triple Quadrant**

**Figure 35:**  
**Quadruple Quadrant**

### ***Extended Magnetic Input Range***

By default the AS5172A and AS5172B operates in Extended Mode. This mode extends the magnetic input field range and allows increasing of the air gap between sensor and magnet. The extended range can be disabled with Extended\_range\_disable bit. For further information about the Extended Mode please refer to application note "AN\_AS5172\_ExtendedMode\_V1-00.pdf".

### ***Rolling Counter***

The frame control bits in the PSI5 frame can be used as a rolling counter. This setting can be enabled in the OTP. If this setting is enabled the rolling counter starts incrementing from value 0x0 once the initialization is finished. When reaching a value of 0x7 the counter is reset at starts with 0x0 again.

In PSI5 16-bit frame mode, the rolling count enables a toggle bit in A14 of the frame.

### Angular Velocity Measurement

The AS5172 features an average angular velocity calculation algorithm with 12-bit resolution. This angular velocity information can be used without further averaging in the ECU. The sensor calculates the velocity for each CORDIC cycle (typ. 128µs). Due to the PS15 interface limitation the information can only be send every 500µs.

To optimize the signal-to-noise performance the cut off frequency is programmable via `Velocity_filter[2:0]` bits in register 0x13. The velocity information is available in all P20CRC-500 and P16CRC-500 modes. Additionally the range of the velocity can be programmed by `Velocity_extended_range` bit in register 0x01.

**Figure 36:**  
Angular Velocity Measurement Parameter

Symbol	Parameter	Min	Typ	Max	Unit	Comments
VRes	Velocity Signal Resolution		12		Bit	
VRange	Measurement Range (default)		1250	1374	°/s	Only typical value is guaranteed
VRangeE	Measurement Range (extended)		5000	5496	°/s	Only typical value is guaranteed
VSens	Velocity Sensitivity (default)		0.671		°/s/Bit	12-bit resolution
VSensE	Velocity Sensitivity (extended)		2.684		°/s/Bit	12-bit resolution, only in Extended Mode
FCutOff	Cut Off Frequency	19	77	260	Hz	Programmable with <code>Velocity_filter[2:0]</code>
VNoise	Velocity Noise	4.9		70.5	°/s	RMS noise depending on <code>Velocity_filter[2:0]</code>
VError	Velocity Total Error			±3.5	%	Clock frequency accuracy

**Figure 37:**  
Angular Velocity Measurement Filter Parameters

Velocity_filter[2:0]	FCutOff [Hz]	VNoise [°/s]	VDelay [ms]	VStepResponse [ms]
000	260	70.5	0.61	0.9
001	152	37.3	1.05	1.8
010	77	19.2	2.07	3.7
011	39	9.7	4.08	6.7
100	19	4.9	8.38	13.9

### Special Functions

The AS5172 features special functions which can be activated in the OTP. This settings are not according the PSi5 V2.1 standard.

#### 14-Bit Mode

The 14-bit mode is only available for AS5172A and AS5172B. In this mode the 14-bit angle information is provided on the PSi5 interface. The 14-bit mode can be activated by PSi5\_14bit\_angle bit. (Quadrant setting must be 00)

This special setting works different to the typical AS5172 transfer function.

If this mode is activated, the sensor uses registers 0x1B to 0x1D as zero offset registers. Additionally the bit Direction in register 0x01 changes the direction of the output function.

**Figure 38:**  
PSi5 Protocol Output Resolution

Symbol	Parameter	Conditions	Value	Unit
OTR_14	Output Resolution 14-Bit Mode	PSi5 V2.1	14	Bit
OT1			-8192	LSB
OT2			+8192	LSB

#### Quadrant Detection

The PSi5 protocol includes an information of the used quadrant. Detection necessary for safety relevant application to detect a movement from one quadrant to the next. See detailed [Protocol Information](#).

#### Extended PSi5 Initialization Phase

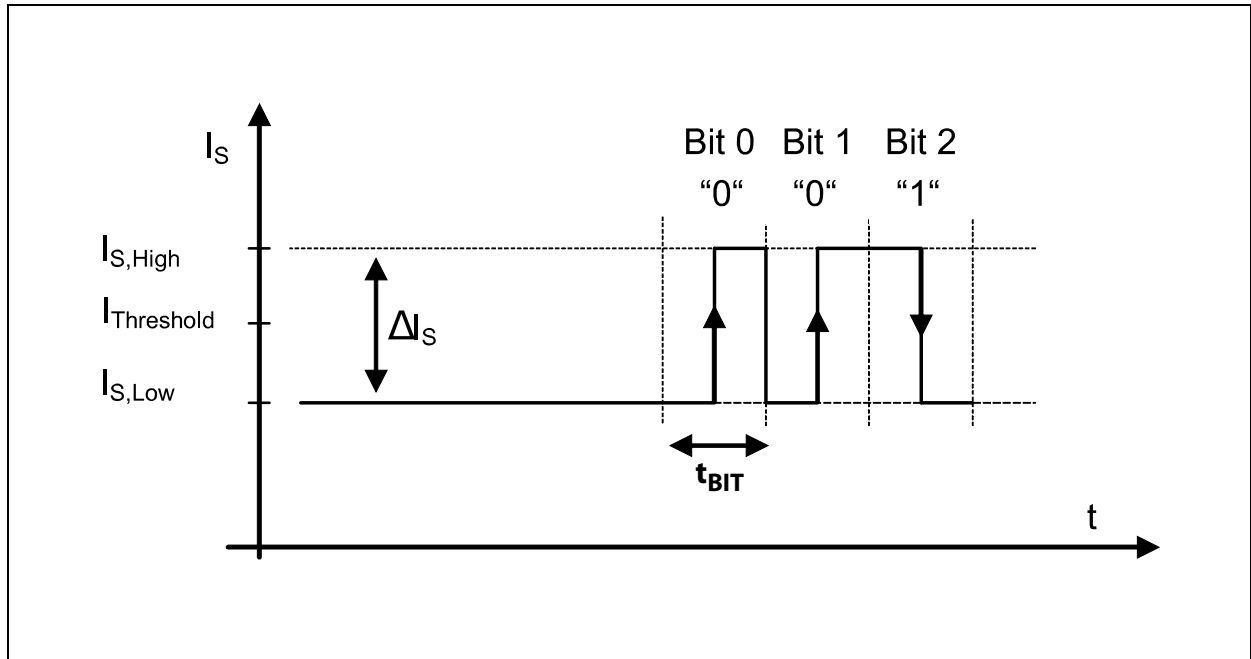

Extending to 32 datablock during Init phase. D1 to D22 according [Figure 67](#). D23 to D32 = 0000. Extension necessary for systems with 32 Datablocks during Init Phase.

### PSI5 Interface

#### Bit Encoding - AS5172 to ECU Communication

A "low" level ( $I_{S,Low}$ ) is represented by the normal (quiescent) current consumption of the Sensor(s). A "high" level ( $I_{S,High}$ ) is generated by an increased current sink of the Sensor ( $I_{S,Low} + \Delta I_S$ ). The current modulation is detected within the receiver Sensor.

**Figure 39:**  
Bit Encoding Using Supply Current Modulation

Manchester coding is used for data transmission. A logic "0" is represented by a rising slope and a logic "1" by a falling slope of the current in the middle of  $t_{Bit}$ .

**Figure 40:**  
Bit Encoding Timing

Symbol	Parameter	Min	Typ	Max	Unit	Comments
$t_{Bit\_L}$	Bit Time (125 kbit/s mode)		8		$\mu s$	16 CLK cycles of the internal 2 MHz clock
$t_{Bit\_H}$	Bit Time (189 kbit/s mode)		5.3		$\mu s$	14 CLK cycles of the internal 2.67 MHz clock

### Data Frames - AS5172 to ECU Communication

Each PS15 data frame consists of N bits containing two start bits and one parity bit with even parity (or 3 CRC bits) and N-3 (N-5) data bits. Data bits are transmitted LSB first. The data frames are sent periodically from the sensor to the ECU. A minimum gap time  $t_{Gap}$  larger than one maximum bit duration  $t_{Bit}$  is required between two data frames.

**Figure 41:**  
Example of a 10-Bit Data Frame

### Data Ranges

The AS5172 supports the data range according PS15 standard V2.1 and V1.3.

PS15 data messages are divided into three separate ranges: A data range for the sensor output signal, a range for status and error messages and a range for initialization data.

#### Data Range According PS15 V1.3

If AS5172 is used in the 10-bit mode, the decimal values  $-480$  to  $+480$  are used for the sensor output signal. The range  $-512$  to  $-481$  is reserved block and data IDs which are used for transmitting initialization data during startup of the AS5172. The range from  $+481$  to  $+511$  is used for status and error messages.

The 10 bit data range is used only in the LowRes mode of the sensor. The 12 bit output value from the DSP has to be mapped to the data range of  $-480$  to  $+480$  (10 bit, signed) by taking only the 10 higher order bits, subtracting the mid-code, and apply clamping to the data range of  $-480$  to  $+480$ .

**Figure 42:**  
Data Range for 10-Bit Mode

Dec	Hex	Signification	Range	
+511	0x1FF	Reserved (ECU internal use) *1	Status and Error Messages	2
:	:	Reserved (ECU internal use) *1		
+504	0x1F8	Reserved (ECU internal use) *1		
+503	0x1F7	Reserved (Sensor use) *2		
+502	0x1F6	Reserved (Sensor use) *2		
+501	0x1F5	Reserved (Sensor use) *2		
+500	0x1F4	“Sensor Defect”		
+499	0x1F3	Reserved (ECU internal use) *1		
:	:	Reserved (ECU internal use) *1		
+496	0x1F0	Reserved (ECU internal use) *1		
+495	0x1EF	Reserved (Sensor use) *2		
:	:	Reserved (Sensor use) *2		
+489	0x1E9	“Sensor in Diagnostic Mode”		
+488	0x1E8	“Sensor Busy”		
+487	0x1E7	“Sensor Ready”		
+486	0x1E6	“Sensor Ready but Unlocked”		
+485	0x1E5	Reserved (Sensor use) *2		
+484	0x1E4	Reserved (Sensor use) *2		
+483	0x1E3	Reserved (Sensor use) *2		
+482	0x1E2	Bidirectional Communication: RC “Error”		
+481	0x1E1	Bidirectional Communication: RC “OK”		
+480	0x1E0	Highest Positive Sensor Signal	Sensor Output Signal	1
:	:	:		
0	0x000	Signal Amplitude “0”		
:	:	:		
-480	0x220	Highest Negative Sensor Signal		

Dec	Hex	Signification	Range	
-481	0x21F	Status Data 1111	Block ID's and Data for Initialization	3
:	:	:		
-496	0x210	Status Data 0000		
-497	0x20F	Block ID 16		
:	:	:		
-512	0x200	Block ID 1		

When using the AS5172 in 10-bit mode the data frame consists of 2 start bits (S1, S2), 10 data bits (D0-D9) which represent the angle and an even parity bit (P).

**Figure 43:**  
Data Frame for 10-Bit Mode

Start Bits		10-Bit Sensor Data (LSB first)										Parity
S1	S2	A0	A1	A2	A3	A4	A5	A6	A7	A8	A9	P
0	0	D0	D1	D2	D3	D4	D5	D6	D7	D8	D9	P

The AS5172 has also the possibility to provide the 12-bit angle value in the PSI5 V1.3 specification.

The substandard vehicle describes this method to map a 12-bit word into a 16 bit data frame and splitting of this into two 10-bit frames.

**Data Range According PS15 V2.1**

If AS5172 is used in the 20-bit mode, the decimal values –30720 to +30720 are used for the sensor output signal. The range –32768 to –30784 is reserved block and data IDs which are used for transmitting initialization data during startup of the AS5172. The range from +31168 to +32767 is used for status and error messages.

**Figure 44:**  
Data Range for 20-Bit Mode

Dec	Hex	Signification	Range	
32767	0x7FFF	Reserved (ECU internal use)	Status and Error Messages	2
+31168	0x79FF	“Sensor Ready”		
:	:			
+30720	0x7800	Highest Positive Sensor Signal	Sensor Output Signal	1
:	:	:		
0	0x0000	Signal Amplitude “0”		
:	:	:		
-30720	0x8800	Highest Negative Sensor Signal		
-30784	0x87FF	Status Data 1111	Block ID's and Data for Initialization	3
:	:	:		
-31744	0x8400	Status Data 0000		
-31808	0x83FF	Block ID 16		
:	:	:		
-32768	0x8000	Block ID 1		

### PSI5 Data Frame 20-Bit Mode with 12-Bit Sensor Data

In 20-bit mode the PSI5 frame consists of 2 start bits (S1, S2), 3 frame control bits (F0, F1, F2), an error status bit (E0), 16 data bits (A0 to A15), and 3 CRC bits (C2, C1, C0).

As described in chapter [Rolling Counter](#) the 3 frame control bits can be used as rolling counter. The error status bit is used to indicate a failure of the sensor to ECU (E0 = 1). If no failure is present this bit is always set to 0. The 12-bit angle information is transmitted on A0 – A11. The upper fields A12 – A15 are set to 0.

**Figure 45:**  
PSI5 Data Frame 20-Bit Mode with 12-Bit Sensor Data

Start Bits		Frame Control			Error Status	12-Bit Sensor Data (LSB first)												CRC						
S1	S2	F0	F1	F2	E0	A0	A1	A2	A3	A4	A5	A6	A7	A8	A9	A10	A11	A12	A13	A14	A15	C2	C1	C0
0	0	C0	C1	C2	E0	D0	D1	D2	D3	D4	D5	D6	D7	D8	D9	D10	D11	0	0	0	0	C2	C1	C0

### PSI5 Data Frame 20-Bit Mode with 12-Bit Sensor Data and Quadrant Detection

For safety relevant applications, where multiple quadrant mode is used, additionally to the 12-bit angle information a quadrant information can be transmitted in A12 and A13. For more information refer to chapter [Multiple Quadrants](#).

**Figure 46:**  
PSI5 Data Frame 20-Bit Mode with 12-Bit Sensor Data and Quadrant Detection

Start Bits		Frame Control			Error Status	12-Bit Sensor Data (LSB first)												Quadrant Info		CRC				
S1	S2	F0	F1	F2	E0	A0	A1	A2	A3	A4	A5	A6	A7	A8	A9	A10	A11	A12	A13	A14	A15	C2	C1	C0

00	Single	Q1 = 00 Q2 = 01
01	Dual	Q1 = 00 Q2 = 01
10	Triple	Q1 = 00 Q2 = 01 Q3 = 10
11	Quadruple	Q1 = 00 Q2 = 01 Q3 = 10 Q4 = 11

### PSI5 Data Frame 20-Bit Mode with 14-Bit Sensor Data

For special applications where the full sensor resolution is necessary over a 360° rotation the AS5172 features a special 14-bit mode. In this mode the 14-bit angle information is transmitted from A0 – A13. A14 and A15 are filled with 0. For more information refer to chapter [14-Bit Mode](#).

**Figure 48:**  
PSI5 Data Frame 20-Bit Mode with 14-Bit Sensor Data

Start Bits		Frame Control			Error Status	14-Bit Sensor Data (LSB first)														CRC				
S1	S2	F0	F1	F2	E0	A0	A1	A2	A3	A4	A5	A6	A7	A8	A9	A10	A11	A12	A13	A14	A15	C2	C1	C0

### PSI5 Data Frame 16-Bit Mode

In 16-bit mode the PSI5 frame consists of 2 start bits (S1, S2), an error status bit (E0), 15 data bits (A0 to A14), and 3 CRC bits (C2, C1, C0).

The error status bit is used to indicate a failure of the sensor to ECU (E0 = 1). If no failure is present this bit is always set to 0. The 16-bit frame can transmit the 12-bit angle information (A0 – A11) but also the 14-bit angle by activating the 14-bit mode in the OTP. (A0 – A13). The field A14 is by default set to 0 but can also be used as a toggle bit by activating the Rolling Counter.

**Figure 49:**  
PSI5 Data Frame 16-Bit Mode with 12-Bit Sensor Data

Start Bits		Error Status	14-Bit Sensor Data (LSB first)														CRC			
S1	S2	E0	A0	A1	A2	A3	A4	A5	A6	A7	A8	A9	A10	A11	A12	A13	A14	C2	C1	C0

### PSI5 Modes

The AS5172 can be configured in several PSI5 modes according standard V1.3 and V2.1. This modes can be selected via registers 0x01, 0x11 and 0x12. The tables in [Figure 45](#) and [Figure 46](#) show the different modes.

Independent from the specific mode also other options can be activated in this registers:

- Low Power Mode
- Initialization phase repetition factor
- Extended Initialization phase (32 blocks)
- Rolling Counter
- 14-Bit Mode
- Velocity Extended Range

**PSI5 Timing**

The following chapter describes the timings for the different PSI5 modes.

The timing is according the internal clock rate of 2 MHz or 2.67 MHz respectively. This clock rates are derived from the main clock of 16 MHz with a  $\pm 3.5\%$  variation.

**Timing Synchronous Mode P10P-500/3L**

**Timing Synchronous Modes P20CRC-500/1L, P20CRC-500/2L, P20CRC-500/2H, P20CRC-500/3H, P16CRC-500/3H**

The supported protocol modes for synchronous transmission with 20bit format are P20CRC-500/1L, P20CRC-500/2L, P20CRC-500/2H and P20CRC-500/3H. For all these modalities except P20CRC-500/1L it is possible to select also the velocity output. In this case two consecutive timeslots will be used.

The protocol P20CRC-500/3H is specifically studied for sensors that must transmit more data on two consecutive timeslots (e.g. angle and velocity). Usually there should be on the bus one sensor transmitting data on timeslot 1 & 2 and another sensor transmitting on timeslot 3, or a sensor transmitting on timeslot 1 and another transmitting on timeslot 2 & 3. Because of the relative tolerances due to the different clocks on the different sensors, the timing of the second timeslot is different when the sensor is transmitting only on one timeslot (not legacy situation for timeslot 2 only but allowed) and when is transmitting also the velocity using 2 consecutive timeslots, differentiating from the case of timeslot 1 & 2 or timeslot 2 & 3.

When there is a new synchronization pulse from the ECU before the current transmission of the AS5172 is finished the current transmission must be stopped and a new transmission has to be started in the programmed time slots.

### PS15 Initialization

The Startup and Initialization is working according the PS15 standard.

After each power on or undervoltage reset, the AS5172 performs an internal initialization which is divided into three phases:

**Figure 62:**  
Start-Up and Initialization

#### Initialization Phase I

During the first initialization phase, no data is transmitted and the ECU can perform a connectivity test. Duration 50 – 150ms; typical 100ms. If using synchronous transmission mode the ECU can terminate the initialization phase I by sending the sync pulse at least 4ms after AS5172 power on.

#### Initialization Phase II

During the second initialization phase, the AS5172 transmits sensor and application specific information to the ECU.

In High Resolution mode the AS5172 transmits the same PS15 frame on both programmed time slots. The same is valid if the velocity output is activated.

For the 20-bit mode the 10-bit values are extended to 20 bits. This is done by shifting the data bits [9:0] to bits A15 to A6. The remaining 6 LSBs are filled with "0". The frame control bits (F0 to F2) and the status bit (E0) are at "0".

**Figure 63:**  
Initialization Phase in 20-Bit Mode

Start Bits		Frame Control			Error Status	16-Bit Sensor Data (LSB first)															CRC				
S1	S2	F0	F1	F2	E0	A0	A1	A2	A3	A4	A5	A6	A7	A8	A9	A10	A11	A12	A13	A14	A15	C2	C1	C0

**Figure 64:**  
Initialization Phase in 16-Bit Mode

Start Bits		Error Status	15-Bit Sensor Data (LSB first)															CRC			
S1	S2	E0	A0	A1	A2	A3	A4	A5	A6	A7	A8	A9	A10	A11	A12	A13	A14	C2	C1	C0	
0	0	0	0	0	0	0	0	0	D0	D1	D2	D3	D4	D5	D6	D7	D8	D9	C2	C1	C0

### Initialization Phase III

During the third initialization phase, the sensor transmits “Sensor Ready”, “Sensor Defect” or other status data. If the sensor is defective, it will continue to send the “Sensor Defect” messages and other optional status data until it is powered off.

“Sensor Ready” Code 0x1E7 at A15 to A6 – if the sensor is OK

“Sensor Defect” Code 0x1F4 at A15 to A6 – if there is an diagnostic error

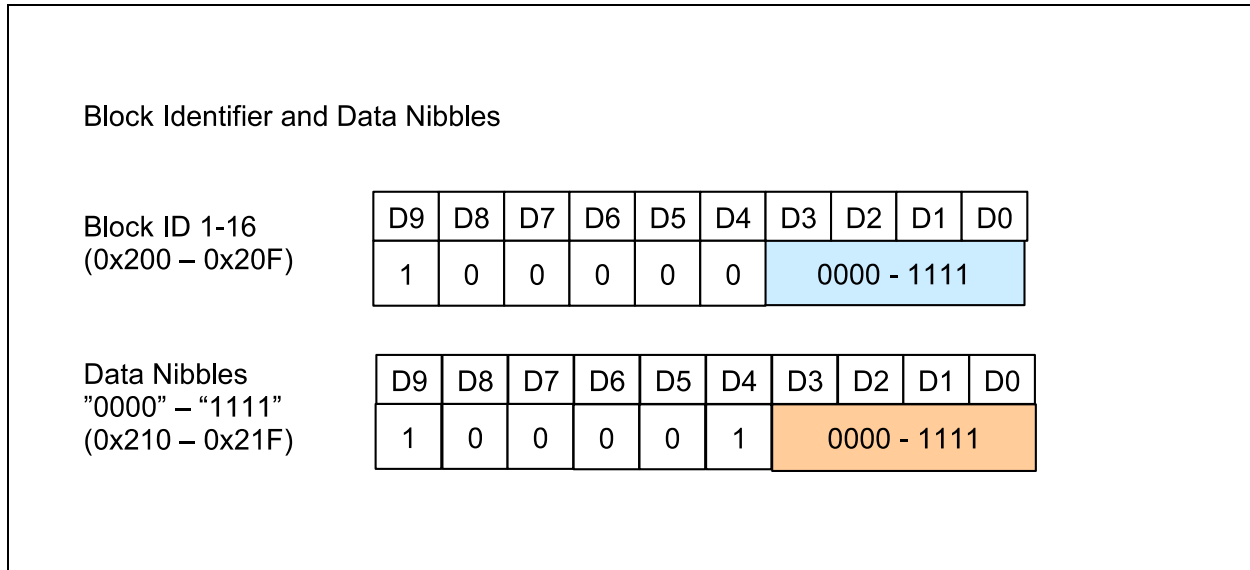

In High Resolution mode the AS5172 transmits the same PSI5 frame on both programmed time slots. The same is valid if the velocity output is activated.

In overvoltage, undervoltage case and AGC High, Low the AS5172 is not reporting this errors in initialization phase III but it will send the error code in the run mode

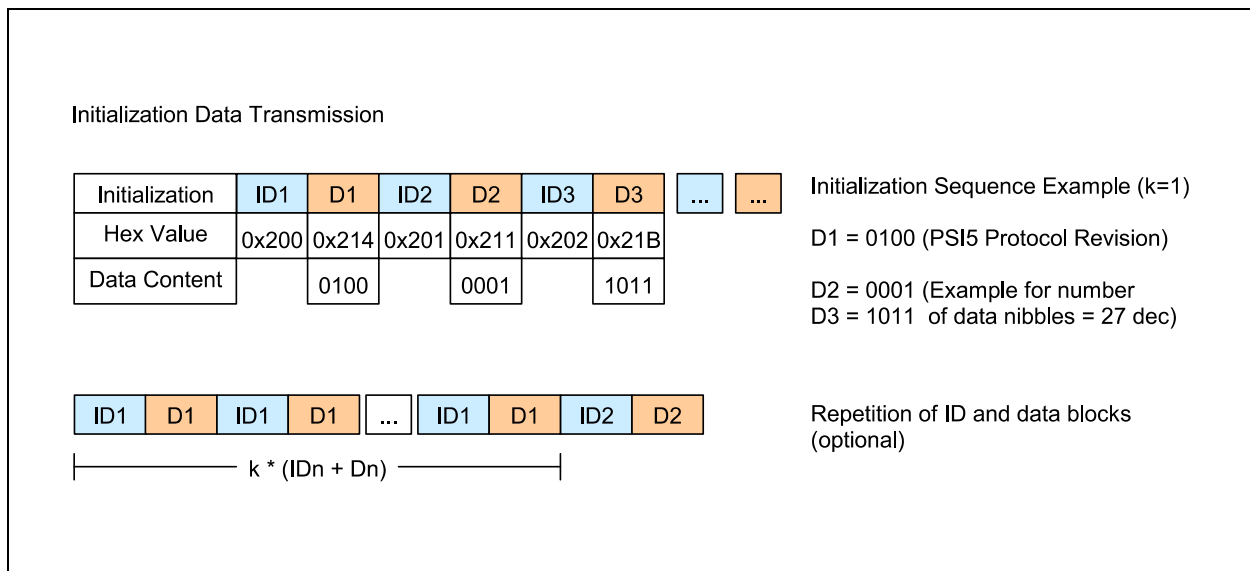

**Initialization Phase Data Format**

ID blocks and data blocks are sent in an alternating sequence, “k” times each. The block identifiers are used for a numbering of the following data nibbles. After any power-on or undervoltage reset, the internal logic starts up with an initialization program. The factor “k” can vary between 1 and 4 and can be configured with “Init\_phase\_repetition” in register 0x12.

**Figure 65:**

**Run Mode**

After finishing Initialization Phase III the AS5172 enters Run Mode. If the sensor is configured in asynchronous mode it will start transmitting data continuously according PSI5 standard. Using the synchronous mode, the transmission is triggered by a sync pulse of the ECU.

If the AS5172 is configured in asynchronous mode, it will transmit the data continuously according the PSI5 Specification.

In case of an application or sensor error, AS5172 is performing in run mode according the description in chapter [Diagnostic](#)

## Communication Modes

### Asynchronous Mode (PSI5-A)

PSI5-A describes a point-to-point connection for unidirectional, asynchronous data transmission.

Each sensor is connected to the ECU by two wires. After switching on the power supply, the sensor starts transmitting data to the ECU periodically. Timing and repetition rate of the data transmission are controlled by the sensor.

**Figure 68:**  
Asynchronous Single Sensor Configuration

**Synchronous Parallel Bus Mode (PSI5-P)**

PSI5-P describes a bus configuration for synchronous data transmission of one or more sensors. Each sensor is connected to the ECU by a separate pair of wires (star topology). Each data transmission period is initiated by a voltage synchronization signal from the ECU to the sensors. Having received the synchronization signal, each sensor starts transmitting its data with the corresponding time shift in the assigned time slot.

**Figure 69:**  
Synchronous Parallel Bus Mode (PSI5-P)

**Synchronous Universal Bus Mode (PSI5-U)**

PSI5-U describes a bus configuration for synchronous data transmission of one or more sensors. The sensors are connected to the ECU in different wiring topologies including splices or pass-through configurations. Each data transmission period is initiated by a voltage synchronization signal from the ECU to the sensors. Having received the synchronization signal, each sensor starts transmitting its data with the corresponding time shift in the assigned time slot.

**Figure 70:**  
**Synchronous Parallel Bus Mode (PSI5-P)**

### Diagnostic

The AS5172 allows a high ASIL level in the application through a robust embedded self-diagnostic. (e.g. ASIL A)

In general, AS5172 sensor is developed as SEooC according to the ISO26262. For more information refer to the AS5172 Safety Manual which is available on request to the application engineering team.

**Figure 71:**  
**Diagnostic Table**

SM	Failure Mode	Recoverable	10-Bit Mode Error Info	16-Bit Mode Error Info	20-Bit Mode Error Info
SM1	Watchdog fail	-	Permanent low level	Permanent low level	Permanent low level
SM2	Offset compensation	X	0x1ED	0x1ED at A9 to A0 E0 = 1	0x1ED at A15 to A6 E0 = 1
SM3	CORDIC overflow	-	0x1F4	0x1F4 at A9 to A0 E0 = 1	0x1F4 at A15 to A6 E0 = 1 A0 = 1
SM4	Magnetic field out of range	X	0x1EB	0x1EB at A9 to A0 E0 = 1	0x1EB at A15 to A6 E0 = 1
SM5	VDD3V3 undervoltage	X	Permanent low level	Permanent low level	Permanent low level
SM6	Reverse polarity	X	Permanent low level	Permanent low level	Permanent low level
SM7	VDD overvoltage	X	0x1EA	0x1EA at A9 to A0 E0 = 1	0x1EA at A15 to A6 E0 = 1
SM8	VDD undervoltage under POR level	-	Permanent low level	Permanent low level	Permanent low level
SM9	VDD undervoltage	X	0x1EC	0x1EC at A9 to A0 E0 = 1	0x1EC at A15 to A6 E0 = 1
SM10	OTP checksum error	-	0x1F4	0x1F4 at A9 to A0 E0 = 1	0x1F4 at A15 to A6 E0 = 1 A2 = 1
SM11	Broken Hall element	-	0x1F4	0x1F4 at A9 to A0 E0 = 1	0x1F4 at A15 to A6 E0 = 1 A3 = 1

**Note(s):**

1. Recoverable: Sensor is working if the error condition is solved

### **Diagnostic Procedure in PS15**

If a OTP checksum error (SM10) occurs after the first OTP download the PS15 interface shows a “Sensor Defect” Code - 0x1F4 in initialization phase III. This error code will be sent until the device is powered off.

If any other diagnostic error condition occurs during initialization phase I or II the error will be masked. It will then be reported in initialization phase III by transmitting “Sensor Defect” Code - 0x1F4.

When a diagnostic error condition appears during PS15 run mode the specific error code will be transmitted on the PS15 interface.

#### **During Run Mode:**

When a diagnostic error condition appears during the PS15 run mode the error code “Sensor Defect” (0x1F4) has to be transmitted on the PS15 interface until the AS5172 is reset by the ECU.

The internal diagnostic error conditions are:

- CORDIC Overflow
- OTP Check fail
- Broken Hall element
- Broken channel
- Watchdog

When an watchdog error is present the PS15\_out signal from the digital part is forced to “0”. Therefore the PS15 interface shows a permanent low level current as long as the watchdog error is present.

When an VDD3 undervoltage is present the PS15\_out signal from the digital part is forced to “0”. Therefore the PS15 interface shows a permanent low level current as long as the VDD3 undervoltage is present.

In magnet field strength out of spec, the AS5172 is transmitting the error code 0x1EB during the PS15 run mode and keeps transmitting this error code until the flag goes to low or the AS5172 is powered off by ECU.

In overvoltage, the AS5172 is transmitting the error code 0x1EA during the PS15 run mode and keeps transmitting this error code until the flag from the analog part goes to low or AS5172 is powered off by ECU.

In undervoltage (between threshold and min VDD), the AS5172 is transmitting the error code 0x1EC during the PS15 run mode and keeps transmitting this error code until the flag from the analog part goes to low or AS5172 is powered off by ECU.

When an undervoltage below the POR threshold is present the PSI5\_out signal from the digital part is forced to "0". Therefore the PSI5 interface shows a permanent low level current as long as the undervoltage is present.

When using the 20bit or 16Bit mode the status message "Sensor Defect" (code 0x1F4) is transmitted at the bits A15 to A6 and also the bit E0 is set to "1" when there is a diagnostic error condition. The frame control bits (F2 to F0) keep the functionality of the frame counter. On the bits A5 to A0 a detailed failure code is transmitted with the following bit assignment

### **System Level EMC/ESD**

AS5172A in the (SiP Package) is built to fulfill system level EMC and ESD standards.

A full certified test report is available upon request. Please get in contact with the application engineering team.

## Application Information

### Signature Calculation

The OTP of AS5172 uses a BIST technique with Multiple Input Signature Register circuits. To activate this BIST a calculation of the Signature Byte is necessary which has to be stored in the OTP during programming. For calculating the signature byte the content of the whole memory (0x01 to 0x1F) has to be read out. Out of this information the following calculation has to be done.

Byte: 0x01 = data1

Byte: 0x02 = data2

...

Byte: 0x1F = data31

```
unsigned int misr, misr_shift, misr_xor, misr_msb;
    misr = 0;
    for (int i = 0; i < 30; i++) {
        misr_shift = (misr << 1);
        misr_xor = (misr_shift ^ content[i]) % 256;
        misr_msb = misr / (128);
        if (misr_msb == 0)
            misr = misr_xor;
        else
            misr = (misr_xor ^ 29) % 256;
    }
content= { data1,data2,data3,data4,data5,data6,
data7,data8,data9,data10,data11,
data12,data13,data14,data15,data16,
data17,data18,data19,data20,data21,data22,
data23,data24,data25,data26,data27,data28,
data29,data30,data31};
```

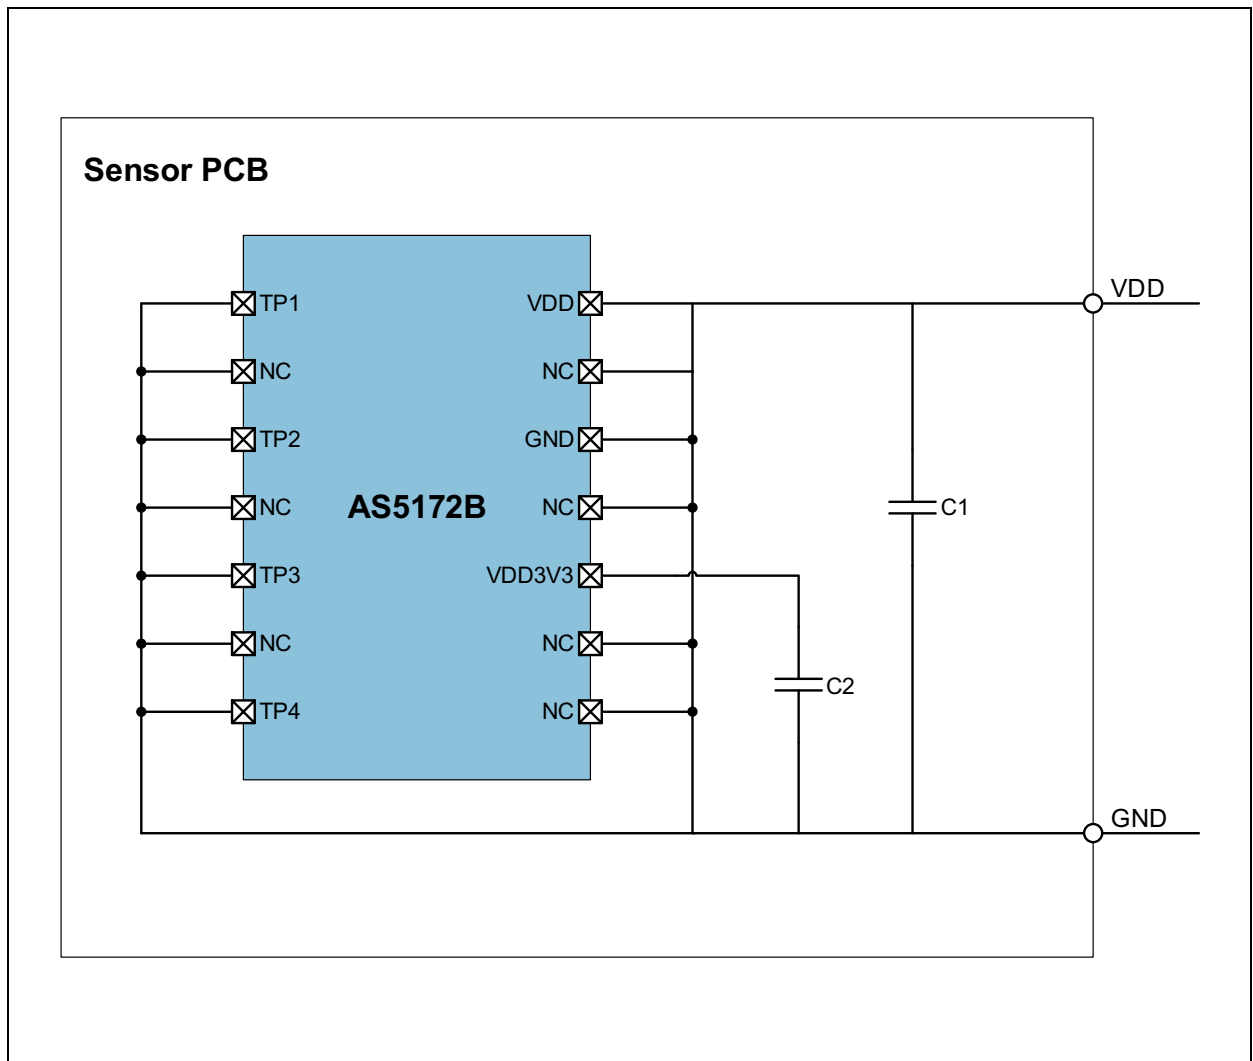

### Programming Procedure

For further information about the programming please refer to application note AN\_AS5172\_Programming\_Procedure\_V1-00. Please get in contact with the application engineering team.

Tracecode

**Figure 80:**  
SIP Packaging Outline Drawing

**Note(s):**

- All linear dimensions are in millimeters, inches are indicated in brackets [in]. Angles are in degrees.
- Dimension D does not include mold flash, protrusions or gate burrs. Mold flash, protrusions or gate burrs shall not exceed 0.3mm (0.012in) per side.
- Dimension b and b1 does not include dam bar protrusion and matte tin plating.  
Allowable dam bar protrusion shall be 0.3mm (0.012in) total in excess of the b, b1, b2 and b3 dimension at maximum material condition.
- Dimension E1 and E2 does not include interlead flash or protrusion. Interlead flash or protrusion shall not exceed 0.3mm (0.012in) per side.
- Dimension tolerance: ±0.15mm unless otherwise specified.

## RoHS Compliant & ams Green Statement

**RoHS:** The term RoHS compliant means that ams AG products fully comply with current RoHS directives. Our semiconductor products do not contain any chemicals for all 6 substance categories, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, RoHS compliant products are suitable for use in specified lead-free processes.

**ams Green (RoHS compliant and no Sb/Br):** ams Green defines that in addition to RoHS compliance, our products are free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material).

**Important Information:** The information provided in this statement represents ams AG knowledge and belief as of the date that it is provided. ams AG bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. ams AG has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. ams AG and ams AG suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

## Copyrights & Disclaimer
